

# **Campana's conjectures on special varieties and the Hilbert property**

**Dr. Ariyan Javanpeykar**  
(Radboud University)

Which varieties over a number field should have a dense set of rational points?

Campana introduced the notion of a special variety in the early 2000s and conjectured that these are precisely the varieties with many rational points.

In this talk I will explain some recent progress on his conjectures.

Joint work with Finn Bartsch, Frederic Campana, and Olivier Wittenberg.
